Over decades, ticks carry pathogens, such as viruses and bacteria, which can affect both animals and humans. Some tick-borne viruses can cause viral hemorrhagic fevers. Ticks are so common in some areas that hikers must wear protective clothing and boots in order to ensure that they are not accidentally infected by a tick bite. Ticks are a problem throughout the United States and also in countries around the world. Although ticks are not a problem in urban areas where homes are built far enough from the ground that the risk of getting a tick bite is low, in arid areas, they are a major problem. Description This section describes WordForge in more detail. How does WordForge work? WordForge works by first having the user load a translation file into a special memory area of the system, this is called the Memory area. The memory area is part of the memory space of the user's computer. It is sometimes called the application space, or simply memory. It is a unique area of the computer's memory in which your programs can run. After loading the translation file, the memory area becomes visible for the user. The user can then load their source text, either a file or the user's keyboard. The source text appears on a text field on the screen. The user selects the target text (the text to be translated) from a list of translatable text items. What does WordForge do? WordForge creates a translatable XML file using the content of the source file and the target text. WordForge also supports other translatable formats such as for example Ditrans, Xolos and Simpo. The generated XML file is called a XLIFF file (XML Localized Interchange File Format). The translated XML file is always saved in the user's computer. The user is now ready to go forward and create their translation file. What formats is WordForge able to translate? WordForge is a standalone software system and only supports the XLIFF format. Other formats like Ditrans, Xolos or Simpo can be used with other WordForge software components, but can not be used as a standalone translation tool. Why is WordForge an online tool and not a stand alone program? WordForge is designed to be an easy to use, intelligent platform-independent offline translation and localization program that works internally with XLIFF format, but also supports other formats. Why is WordForge an online tool and not a stand alone program? What does it mean to make a translation online? The online translation means that the translated XLIFF file will be stored in a dedicated cloud storage server. From this server the file can be retrieved by the user and then sent for translation to the specified translation service (API). This means that the user can not only see their translated file on their own computer, but also send it to a selected
