What's New In Smart HTTPS For Chrome?

Smart HTTPS checks whether the website you are visiting has HTTPS or not. If it does not, it will automatically switch to HTTPS without user interaction. If the website does have HTTPS, it will automatically revert back to HTTP when finished. This plugin checks the websites you visit regularly (e.g. Facebook, Amazon, Twitter) as well as websites you browse with links to Facebook, Amazon, and Twitter. It does not support a manual switch back to HTTP. "The "s" at the end of HTTPS stands for "secure" and, in plain words, it basically means that your connection between the currently visited website and your computer's web browser is encrypted. Since Google included HTTPS as one of the key ranking parameters within its algorithm, more and more websites are making the switch from HTTP. Having said that, it's only natural that you would want to go for the more secure HTTPS option but, unfortunately, not all websites currently support this protocol. Automatic HTTPS enforcer for Google Chrome

This is where Smart HTTPS comes into its own. In just a few words, Smart HTTPS is a Chrome extension (and it also has companion extensions for Opera and Firefox) that takes care of the nuisance of checking whether a website has support for HTTPS or not without any type of user intervention. For example, when you visit any given HTTP website, the extension unobtrusively changes to the secure HTTPS protocol and, if it is not available, it seamlessly reverts to HTTP, as if nothing has happened. As you can imagine, the extension does not have any effect on websites that already run HTTPS. Automatically changes to HTTPS, if this is supported by the website's server Even though Smart HTTPS is mainly a hands-off extension, its compact UI acts as a simplistic control panel. For example, you can enable or disable the extension or, even more importantly, you can force load any website in HTTPS and manually revert it to HTTP. The reason we mention this is as follow: because the whole HTTPS automatic procedure takes a bit longer than a typical loading process (as expect), the extension automatically saves all the websites that don't support HTTPS. These will find their way into the Whitelisted Domain list. This brings us to the Blacklisted Domain list. Simply put, this is the place where domains that only load in HTTPS go, but solely if the webpage has multiple errors and there's no way of reverting to HTTP for a smooth connection. Well thought-out extension that manages to be both efficient and extremely unobtrusive Taking everything into account, HTTPS Smart is one

System Requirements:

Minimum requirements: OS: Windows XP Processor: Dual-core CPU @ 2.8 GHz Memory: 2 GB RAM Graphics: DirectX®: 9.0 Storage: 50 GB available hard disk space More information about the official minimum and recommended hardware requirements can be found here. The minimum requirements are recommended because not every scene (even the most demanding) requires a high-end PC. If you are a casual user, you are recommended to use a
